

OatAotOat's Procedural Digital Asset Bedroom Furniture Pack

Documentation & Guide

1. Introduction & Quick Start

Welcome to *OatAotOat's Procedural Digital Asset - Bedroom Furniture Pack*,
A modular system for rapidly generating highly customizable furniture and rooms,
Designed for quick iteration by level designers and extensibility by programmers.

The Procedural Room Randomizer

The core of rapid prototyping. Drop the Randomizer into the scene, set your dimensions, and shuffle the seed to automatically populate a structured room.

The Randomizer Inspector and Visual Footprint Gizmos

The resulting baked room geometry

1. Drag the `ProceduralRoomRandomizer` prefab into an empty scene.
2. Assign a `FurnitureTheme` to the Themes list.
3. Click **SHUFFLE** to preview footprints via Gizmos,
then click **GENERATE RANDOM BEDROOM**.

2. The Global Theme & Color System

Maintain consistent art direction across multiple procedural props without manually adjusting every slider.

Furniture Theme Inspector

Color Palette Inspector

- The `FurnitureTheme` ScriptableObject enforces global dimensions (leg thickness, frame thickness) and styles (pedestal, four-leg) across the entire room.
- Create custom Color Palettes to quickly assign harmonious primary and secondary colors directly inside the generator UI.

3. Component Reference (Prop Generators)

Each prop generator inherits from `ProceduralGenerator` and features a custom tabbed Inspector for a clean UI.

Custom Tabbed Inspector Layout

Procedural Chair Variations

Generate distinct styles dynamically. From single pedestal seats to four-legged frames with rockers.

Pedestal

Four-Leg

Rockers

Procedural Shelf & Storage

Toggle between bookshelf generation (populated with randomized books) and a TV cabinet setup.

Bookshelf Mode

TV Cabinet Mode

Advanced Meshes: Shearing & Articulation

Procedural Shearing

Articulated Desk Lamp

- The `UniversalShear` algorithm modifies vertices dynamically, allowing clean tapers and leg splay angles without breaking geometry.
- Adjust angles for lower arms, upper arms, and shades directly via sliders to perfectly pose your props.

4. Baking & Workflow Integration

Procedural meshes generated in real-time use `MeshFilter.sharedMesh` modifications. To prevent memory leaks and ensure the assets are production-ready, they must be baked.

Hierarchy & Baking UI

Clean Output Folder Structure

Clicking Bake to Prefab extracts dynamic meshes into `.asset` files, generates permanent `.mat` files, strips away real-time generation scripts, and saves a clean Prefab into your project.
